SAND NO SAND2017-5474 PE

Bottom Line Up Front

How you choose to license your software should be viewed as a <u>tool</u> to help accomplish your goals for that software. <u>There is no</u> <u>universal "right answer"!</u>

This tutorial will present common terminology, and examples of some of the considerations that might go into choosing a license.

The intent is to get you thinking, not to give you answers.

Some terminology and background

4 Better Scientific Software tutorial @ ATPESC 2018-08-08

Copyright and software licensing

- Copyright grants the creator of an original work exclusive rights to its use and distribution
- Rights of particular interest for software include
 - Reproduction and distribution
 - Derivative works
- Licenses are used to transfer rights in the work from one party to another

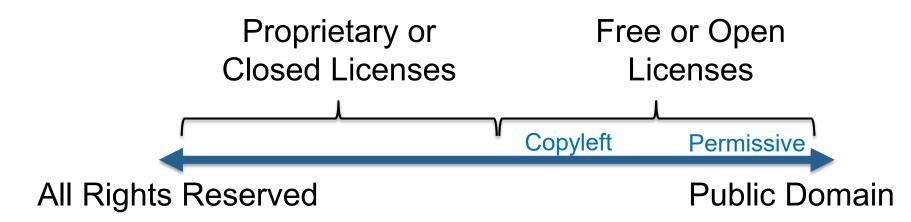

Your software starts out copyrighted

- Under the law, the software you write is subject to copyright on creation
 - You don't have to do anything special to claim copyright
- The copyright owner may be you, or your employer
 - "Work for hire" (i.e. as part of your job) is probably owned by your employer. Employment contracts often make IP rights explicit.
- Exception: Works created by the US government cannot be copyrighted
 - They are considered to be in the public domain
 - Comment: This was originally to ensure public access to the US legal code

The licensing spectrum

Free vs Open Source?

- "Free" in licensing discussions should refer strictly to "freedom" (to do certain things with the software)
- Often gets conflated with "free as in beer", muddling the discussion. Hence some prefer term "open source"

Major names in Free/Open Source Software:

- Free Software Foundation (FSF) http://fsf.org/licensing
- Open Source Initiative (OSI) <u>http://opensource.org</u>

Common misconception: Nothing in the definition of free or open source software prevents you from charging for the software or otherwise making money from it!

7 Better Scientific Software tutorial @ ATPESC 2018-08-08

Defining free software: The four freedoms

From the Free Software Foundation

- The freedom to **run the program** for any purpose
- The freedom to study how the program works, and change it so it does your computing as you wish
 - Access to the source code is a precondition for this
- The freedom to **redistribute copies** so you can help your neighbor
- The freedom to distribute copies of your modified versions to others. By doing this you can give the whole community a chance to benefit from your changes
 - Access to the source code is a precondition for this

The OSI has a definition which amounts to the same thing

Permissive vs copyleft OS licenses

Permissive

- Licensee can distribute derivative works as they see fit
 - Relicensing of derivatives is allowed
 - Including proprietary licenses
- Examples
 - Apache License
 - MIT License
 - BSD License

Copyleft

- Licensee must distribute
 derivative works as open source
 - Also referred to as "restrictive" or "viral"
- Examples – GPL (v2 and v3)
 - LGPL

Note: Derived works may be held private and never released

What is a derivative work?

- A derivative work is an expressive creation that includes major copyrightprotected elements of a previously created first work (Wikipedia)
- Modifications to someone else's software
- What about linking to a library? (Statically vs dynamically?) Interacting via pipes? Use as a component in a coupled multiphysics application?
 - Opinions differ
 - FSF (GPL) considers everything in a single executable to be a derived work (source of "viral" label)
 - LGPL created for libraries says linking not considered derived work
 - Matters less for permissive licenses
 - Leads to concerns over "compatibility" in combining software under different licenses

Test: Is this an open source license? (A real-world example)

In order to acquire access to the code sources, the recipient agrees:

- to compile/use the XYZZY source code AS IS without modification; users however are welcome to request changes, or to contribute modifications subject to approval of the authors;
- 2. if the copy of the XYZZY downloaded by the authorized user is made available to third parties, to ensure that the user agreement is followed by the third parties;
- 3. to send a one-time email to xyzzy@example.com describing planned research using that module
- 4. prior to publication, to email a draft of the article/letter/note to xyzzy@example.com
- 5. to include in published results or presentations the proper code name(s) and appropriate references.

Answer: Is this an open source license? No (A real-world example)

In order to acquire access to the code sources, the recipient agrees:

- to compile/use the XYZZY source code AS IS without modification; users however are welcome to request changes, or to contribute modifications subject to approval of the authors;
- 2. if the copy of the XYZZY downloaded by the authorized user is made available to third parties, to ensure that the user agreement is followed by the third parties;

This violates the freedom of being able to distribute copies of your modified version of the code to others

Perhaps they want to impose some measure of "quality control" over modifications? Maybe they've had problems in the past with users distributing modified code with errors that are believed to reflect poorly on the original code?

Some open source licenses include a requirement that derivatives must be clearly distinguished from the original (e.g., different name)

Choosing a license

13 Better Scientific Software tutorial @ ATPESC 2018-08-08

Considerations in choosing a license

- What rights do you want to retain or grant?
 - Who can use the program? (proprietary vs open)
 - Can users see the source code? (proprietary vs open)
 - Can users modify the source code? (proprietary vs open)
 - Can the users redistribute original or modified code? (proprietary vs open)
 - Can modified code be relicensed? (permissive vs copyleft)
- Compatibility with software under other licenses
 - Permissive licenses have fewer issues
 - http://www.fsf.org/licensing/
- Labeling of derived works
 - Derived works must be identified differently than original work
- Patent grant/retaliation

Use an existing free/open source license rather than inventing a new one! FSF and OSI certify many existing licenses (~80) as meeting their criteria

Popular OSI-approved licenses

License	Туре	GPL-Compatible	Patent Grant
Apache License, 2.0	Permissive	v3,not v2	yes
BSD 3-Clause "New" or "Revised" license	Permissive	yes	silent
BSD 2-Clause "Simplified" or "FreeBSD" license	Permissive	yes	silent
GNU General Public License (GPL)	Copyleft	yes	yes
GNU Library or "Lesser" General Public License (LGPL)	Weak Copyleft	yes	yes
MIT license (MIT)	Permissive	yes	silent
Mozilla Public License 2.0	Permissive	yes	yes
Common Development and Distribution License	Permissive	no	yes
Eclipse Public License	Weak Copyleft	no	yes

Consideration: Software business models

Approach	Proprietary	Copyleft	Permissive
Sell the software	yes	yes	yes
Sell to commercial users aka dual licensing	n/a	yes	yes
Relicense to proprietary	n/a	no	yes
Sell convenience , e.g., packaging, installation media, pre- compiled executables	yes	yes	yes
Sell professional services around the software, e.g., training, technical support, consulting	yes	yes	yes
Sell custom development services , e.g., proprietary extensions, accelerated development	yes	yes	yes
Sell software-as-a-service (SaaS)	yes	yes	yes
Sell the research	yes	yes	yes
etter Scientific Software tutorial @ ATPESC 2018-08-08	productivi	S E	EXASCALE COMPUTING PROJECT

Consideration: Don't want others to profit from my open source software

- A permissive license allows someone else to take derivatives proprietary
- A copyleft license will prevent that

But there may be other considerations...

- What if you do want a commercial entity to use your software?
 - Exposure, broader distribution
- Copyleft is scary to many commercial entities
 - How far does the viral license reach into other parts of the product?
 - Legal opinions differ, no case law yet
 - Lawyers will tend toward a conservative answer: avoid copyleft software
 - Experience: some companies will not consider working with copyleft software
 - Experience: some companies consider staff working on copyleft software to be "contaminated" and will not allow them work on other software

Consideration: Protecting my intellectual property

- If I make my source code freely available, then others can use the novel ideas embodied in it to "scoop" me
- Proprietary licenses (obviously) allow you to keep source private
- Open source licenses don't require that you make derived works public, only that <u>if</u> you do, you make the source available
 - Delay public release until you've had a reasonable chance to exploit the results of your work
 - Until initial papers are published
 - Fixed time period (e.g., one year)

Considerations favoring open source

- Challenges of managing and archiving the paperwork associated with proprietary licenses
- Explicit license agreements can inhibit (legal) use of software
- I want to support peer review and reproducibility in science
- My sponsor requires that I release my software as open source
- I believe that the results of publicly-funded research should be publicly available
- I want to build a self-sustaining community around my software

A few more points about our real-world example

In order to acquire access to the code sources, the recipient agrees:

- to compile/use the XYZZY source code AS IS without modification; users however are welcome to request changes, or to contribute modifications subject to approval of the authors;
- 2. if the copy of the XYZZY downloaded by the authorized user is made available to third parties, to ensure that the user agreement is followed by the third parties;
- 3. to send a one-time email to xyzzy@example.com describing planned research using that module
- 4. prior to publication, to email a draft of the article/letter/note to xyzzy@example.com
- 5. to include in published results or presentations the proper code name(s) and appropriate references.

Why are these Clauses Included?

4. prior to publication, to email a draft of the article/letter/note to xyzzy@example.com

An attempt to address prior experience with users misusing the code and producing publications with erroneous results, thus reflecting poorly on the code used to obtain them.

Creates a burden on the code owners.

Not sure how strongly they attempt to enforce this.

5. to include in published results or presentations the proper code name(s) and appropriate references.

A natural desire for the software to be credited in papers where it is used.

Does not violate free/open source software principles. But I'm not aware of a widely used open source license which includes such a clause.

Perhaps a CITATION file in the distribution is an alternative?

Some related matters

Software Licenses Can be Changed

- You may start out using one license for your code and later discover unanticipated problems
- Or maybe your goals change

But changing licenses is not necessarily easy

- (Generally) each and every contributor to a code holds a copyright interest in it
- Each and every contributor must be contacted and agree to the relicensing
 - In practice, different institutions may have different ideas of "due diligence"
 - Keep good records of contributors; try to keep them current
- Contributor license agreements (CLAs) and contribution transfer agreements (CTAs) can simplify this
 - But present different challenges (see next slide)

Accepting code contributions

- Code contributions are implicitly offered under current license
- Some projects require a contributor agreement
 - Contributor license agreement (CLA) defines the terms between the contributor and the maintainers of the software
 - Contributor transfer agreement (CTA) transfers copyright ownership from contributor to maintainers
- Why?
 - Člarify or make explicit terms of contribution (awareness by contributor)
 - Obtain additional rights, e.g., relicensing, patents, etc.
 - Ensure "clear title" to make the contribution
- Why not?
 - Creates "barriers to entry" may discourage potential contributors
 - Legal agreements that may require official review and signature
 - Experience: Lost funding for a project because lawyers wouldn't agree to terms of a CLA
- See Resources slide for several viewpoints

Managing copyright notices in software

- Need to assert copyright and make license terms explicit
- Do these centrally or in every file?
 - Single COPYING or LICENSE file per package (or directory)
 - In comments at the top of the file
 - Advantages and disadvantages to each
- Best practice: do both
 - Intelligently, to make it as easy to maintain as possible
- Authorship (separate, but related)
 - Version control is best way to maintain accurate records of authorship
- See <u>Managing Copyright Information within a Free Software Project</u> for detailed discussion

Open licensing of non-software artifacts

- Creative Commons is a family of licenses analogous to open source, but for things other than software
- License variants
 - CC BY (Attribution)
 - CC BY-SA (Attribution-ShareAlike)
 - CC BY-ND (Attribution-NoDerivs)
 - CC BY-NC (Attribution-NonCommercial)
 - CC BY-NC-SA (Attribution-NonCommercial-ShareAlike)
 - CC BY-NC-ND (Attribution-NonCommercial-NoDerivs)
- CC0 Public Domain Dedication
 - Indicates intent to place artifact in the public domain
 - Doesn't satisfy legal requirements in all jurisdictions
- See <u>https://creativecommons.org</u>
